(54) SPECIMEN ANALYZING TOOL AND METHOD
AND INSTRUMENT FOR ANALYZING
SPECIMEN USING IT

(57) Abstract:

PROBLEM TO BE SOLVED: To provide a specimen analyzing tool which can quickly and accurately analyze a small quantity of specimen and is not restricted in direction on a measuring instrument.

SOLUTION: The specimen analyzing tool is constituted in such a way that the planar main body 5 of the tool having a rectangular shape is composed of a resin substrate 5b and a transparent cover 5a and, on the surface side of the substrate 5b, a first flat cylindrical recessed section is formed and a groove is formed in a state where the groove is communicated with the recessed section and extended to the front end of the projecting section 5c of the substrate 5b, and then, a second flat cylindrical recessed section which is smaller in size than the first recessed section is formed in the middle of the groove and the front end of the groove is opened toward the outside at the front end of the projecting section 5a. Then the sur-

face of the substrate 5b is covered with the cover 5a and the cover 5a is united with the substrate 5b in one body so that the first recessed section, groove, second recessed section, and front-end opening of the groove can be respectively formed as a drag generating chamber 1, a suction flow passage 2, an analyzing section 3, and a suction port 4.
